

Learn Jargon Buster

STP	Straight Through Processing, requiring no manual intervention
Enrichment	Improving key identification criteria from information found in the message
Repair	Deducing key identifiers from information found in the message

Learn is an STP evaluation engine with a dedicated reporting tool set. As the traffic analysis of financial institutions is the fundamental starting point in the process of optimising straight-through-processing Viveo has developed the Learn solution. It is based on concrete demands from our user community for a tool that qualifies messages for STP.

Messages are analysed before and after repair in order to highlight areas where rules might be developed to improve STP rates. In this way Repair can 'learn' more about the messages being processed and propose new rules for evaluation. It also tests and validates the effectiveness of proposed rules prior to implementation in a production environment. Learn is a powerful tool for determining the cost effectiveness of rule implementation and in measuring STP rates for existing message processing systems.

Messages are assessed against two principal rule sets:

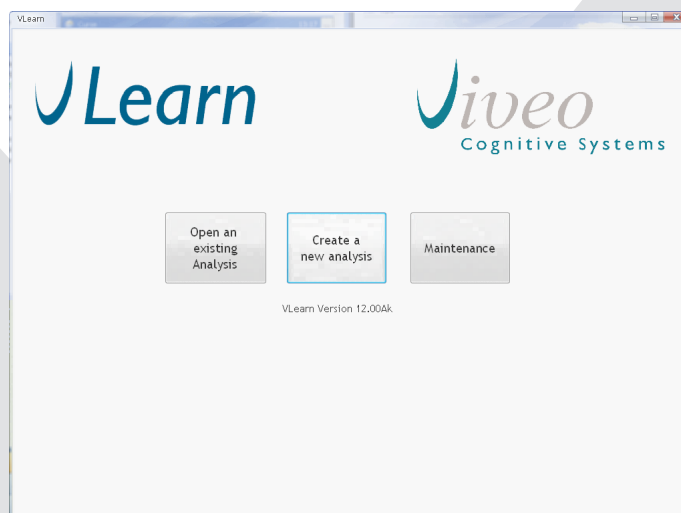

- The widely-accepted criteria for STP
- Financial institution-specific rules (which may vary according to a number of parameters such as sender, currency, etc.)

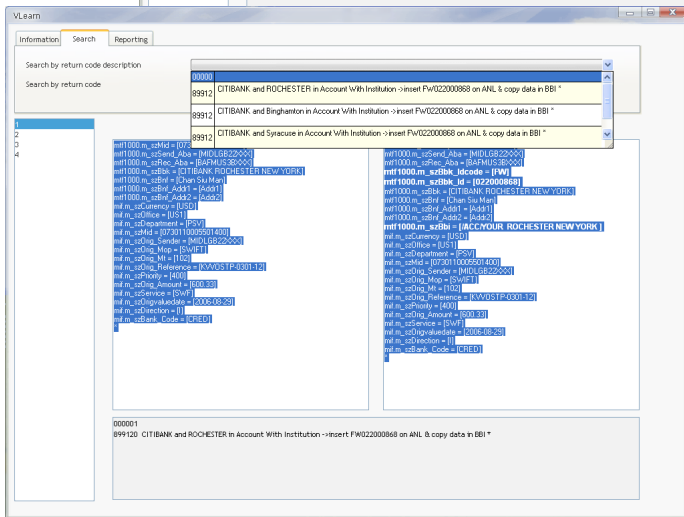

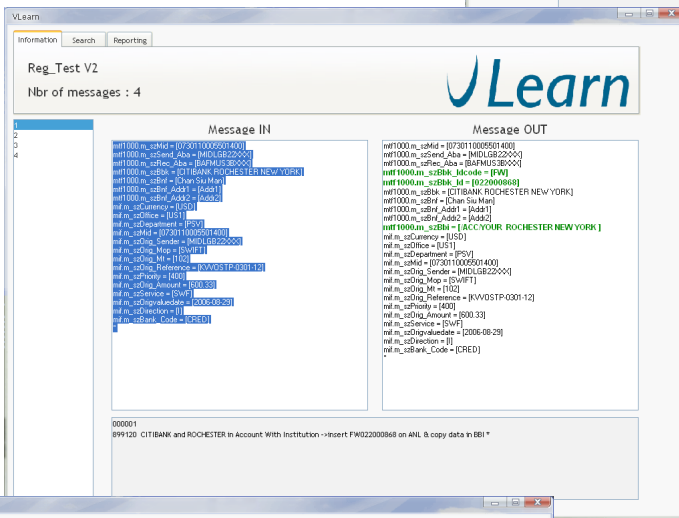

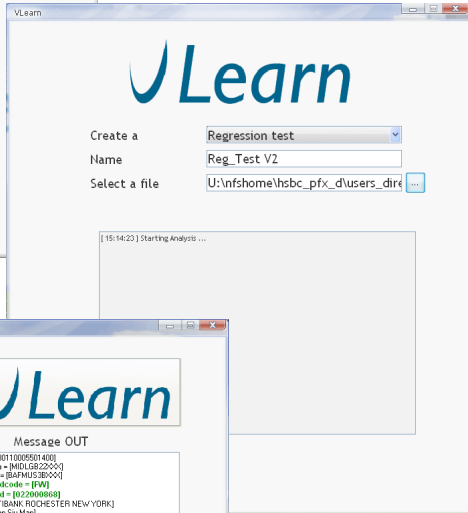

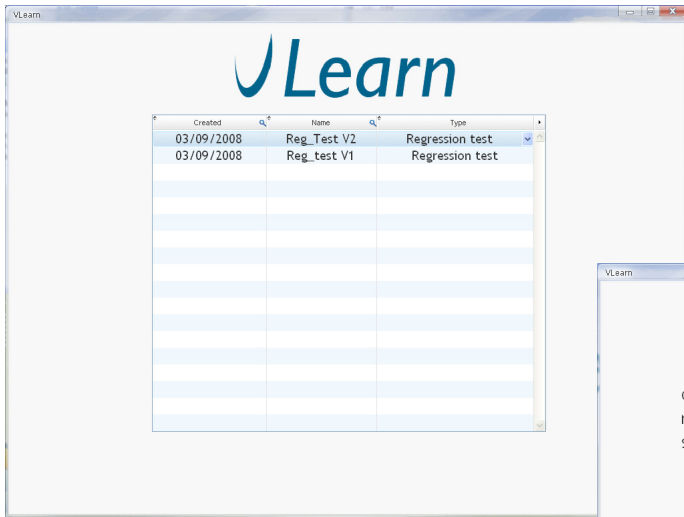

Learn provides a set of standard reports with enrichment solution proposals. In addition, Learn can also create customised report templates of which the structure of the underlying repository is available to clients, facilitating in-house reporting. Learn is also able to take measurements at any point in the process flow making it possible to determine a range of accounting indicators.

Learn functionality includes facility to

- Create accurate invoices for back-charging
- Provide detailed business information to correspondents

Learn is produced and supported by VCS, a company specialising in STP improvement and with a proven pedigree in the marketplace. Learn is part of the STeP suite.
